REVIEW SCOPE

3 systems

The question and the boundary

Where do responsibilities and evidence need to be clearer before the next handover? This First Review covers one legal entity and three named business systems: workplace identity, the order application and the shared document workspace.

Five stakeholder conversations and supplied process notes form the evidence set. Participants are the internal IT manager, an IT-provider representative, operations lead, procurement lead and a business process owner. The working shape is five consulting days arranged across two calendar weeks.

Sample materials comprise a joiner/mover/leaver checklist, interruption contact sheet and supplier register. No accounts, credentials, production records or supplier systems were accessed.

Fictional example, not an actual assessment.

All company details, materials and observations are constructed. No technical testing, recovery exercise or audit took place. This report does not certify compliance, establish the absence of vulnerabilities or guarantee security.

Keep the evidence beside the action.

These are process observations for discussion. Sequencing windows describe a possible order of work, not a technical severity scale or a promise that risk is removed.

R01 / ACCESS HANDOVER / FIRST 30 DAYS

Name the final handover verifier.

Sample evidence

The synthetic joiner/mover/leaver checklist names an internal requestor and an IT-provider implementer, but no role verifies that the handover is complete.

Question to resolve

Who confirms that the requested change matches the completed change, and where is that confirmation recorded?

Bounded next action

Agree a final verifier role with the IT provider. Add a completion check to the handover record and try it on an anonymised example.

Unverified areas

No user account or live access record was inspected. The review does not establish whether any access is inappropriate.

Proposed owner: Internal IT manager, with the IT provider

R02 / INTERRUPTION READINESS / DAYS 31-60

Put alternate decisions in the plan.

Sample evidence

The sample interruption contact sheet names operational roles, but does not say who can take the decision when the primary role-holder is unavailable.

Question to resolve

If a primary decision owner cannot be reached, who has the authority and context to act?

Bounded next action

Agree alternate decision owners for the chosen interruption scenario. Use a short discussion exercise to check the contact and escalation sequence.

Unverified areas

No response exercise or recovery test took place. The document review cannot establish how people would act during a real interruption.

Proposed owner: Operations lead, supported by internal IT

Make dependencies part of the handover.

R03 / SUPPLIER CONTEXT / DAYS 61-90

Connect suppliers to the work.

Sample evidence

The illustrative supplier register lists contract owners but does not identify the business process depending on each named supplier.

Question to resolve

Which day-to-day activity would need a different arrangement if this supplier was unavailable?

Bounded next action

Add the supported business process and its owner for up to five chosen suppliers. Record unanswered dependency questions for follow-up.

Unverified areas

No supplier was contacted or audited. The sample evidence does not establish a supplier control standard or assurance rating.

Proposed owner: Procurement lead, with business process owners

An example sequence

Window	Action focus	Proposed owner
First 30 days	R01 / Name the final handover verifier.	Internal IT manager, with the IT provider
Days 31-60	R02 / Put alternate decisions in the plan.	Operations lead, supported by internal IT
Days 61-90	R03 / Connect suppliers to the work.	Procurement lead, with business process owners

At the readout, confirm whether each role can accept the action, what approval it needs and whether the timing fits actual capacity. The organisation owns the decision and implementation.

The suggested 90-day sequence is illustrative. It is not a remedial deadline, certification condition or guarantee that a security concern is resolved.

Leave the unanswered questions visible.

Read it together

The readout turns the register into a conversation with the people who can act. A role written in the report still needs to accept ownership.

1. Confirm which observations are supported by the agreed evidence and record any disagreement.
2. Ask each proposed owner whether they can accept the next action and what support or approval they need.
3. Record the decision, dependencies and next review point alongside the action.

What this work has not established

- Live access configuration or whether an account has inappropriate permissions.
- Actual interruption response, recovery performance or operational readiness.
- Supplier control standards, audit conclusions or assurance ratings.
- Completeness or accuracy of every underlying process record.

Those areas remain unverified and would require separately scoped work. Document review does not become technical testing, and a completed action register is not proof of security.

Questions for the handover

Which action is accepted? Who can authorise it? What dependency could prevent it? What evidence would show that the agreed next step was completed? When will the responsible people discuss it again?

Stonepath's role

Explain the scope, evidence, observations and limits. Make the next decisions visible at the readout.

The organisation's role

Accept or challenge actions, assign accountable owners and take implementation forward.
